

Coastal Outfitters is an outdoor retail company with approximately 250 employees operating both online and through physical store locations. A risk assessment was conducted on ten organizational assets to identify threats, vulnerabilities, and potential business impacts. Several critical risks were identified, including phishing attempts targeting Microsoft 365 users, credential theft affecting Active Directory and VPN services, malware risks on employee systems, and potential data leakage from cloud storage systems. The organization's overall risk posture was assessed as Moderate to High and requires remediation efforts to reduce exposure. Recommended actions include improving employee security awareness training, strengthening password requirements, implementing multi-factor authentication (MFA), and improving procedures related to cloud storage and access management.
